**SUBJECT: NEW FLUSH MOUNT REMOTE SYSTEMS**

A new remote flush mount model is now available for the KM-800MRE and KM-1200MRE units.

The remote line connections, water connection and electrical supply openings are relocated to the top of the unit. The drain connections are relocated to the left side of the unit. This allows the unit to be installed flush against the wall to conserve floor space.

The top panel must be removed to access the electrical junction boxes when making the initial electrical connections.

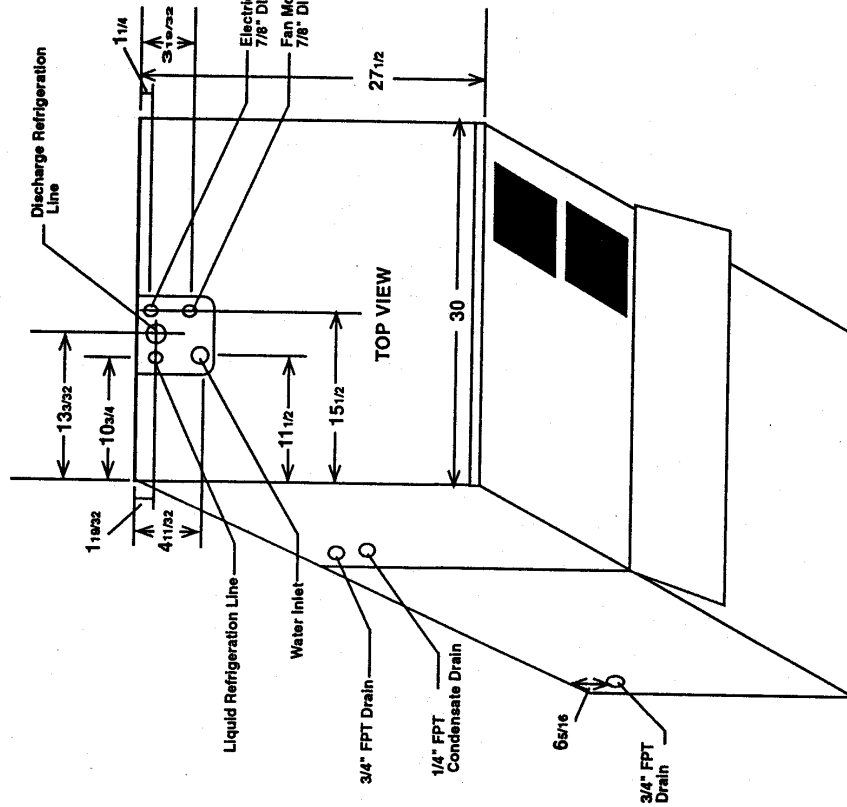

The condensate drain has been changed from the 3/8" ID flex tubing to a 1/4" FPT connection which should be piped in the normal manner.

To compliment this unit, a flush mount B-500SD bin is available with a left side drain outlet.

See attached drawings for dimensions and connections.
